# CVWO final submission writeup

Name: Cheng Lit Yaw
Matriculation Number: A0185639M

Being a web application developer, I will never be satisfied as the more I program, the more I want to improve my web application. As I pay close attention to the web application, I would tweak the alignment of every button, every title and every listing. I never thought about the vast potential of Ruby on Rails as the community threads on Stackoverflow were ancient in the context of web development. Turns out there is still much more for me to learn.  I managed to develop a working web application through this experience, and I am hungry to improve when time permits.

To give a brief walkthrough on "Daily Tasks", the navbar enables the user to create a new list as well as to toggle the visibility of the sidebar. On the sidebar, users are able to select their display the tasks based on the lists that they created. The main element of the page enables users are able to add new tasks onto their lists and it enables users to edit, delete and check off their tasks created.

This assignment has taught me how to learn and develop a web application with Ruby on Rails. It has also taught me overall design and architecture of the application is important during development. I had to go through a few idea iterations before landing on a solid foundation. Though it might not be the best version, but I am constantly improving it when possible. I would like to thank CVWO for giving me such an opportunity to develop on my software engineering skills and I hope for many more opportunities like these. Enjoy Daily Tasks!
